001-138146/14. AAB50476 cterial autoinducer inactivation proteins and nucleic acids my the protein, for increasing disease resistance, preventing or my bacterial damage to a plant or animal, or treating bacterial ions in animals.

2; Fig 4A; 49pp; English.

The present sequence is a nucleic acid encoding a bacterial autoinducer inactivation protein (AiiA). It is useful for increasing disease resistance as well as preventing or reducing bacterial damage to a plant or animal. The nucleic acid may be used to confer resistance to diseases where expression of pathogenic genes are regulated by autoinducers, such as diseases caused by Pseudomonas aeruginosa, Erwinia stewatii, Xenorhabdus nematophilus, Erwinia chrysanthemi, Pseudomonas solanacearum and Xanthomonas campestris. It may also be used to confer soft rot disease resistance in susceptible plants such as potato, eggplant,

υ

```
The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotide encoding autoinducer inactivation protein, bacterium having polynucleotide, and protein useful for increasing resistance to a disease in sustainable plant or animal and for reducing bacterial damage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            ਨੇ
biofilm-forming bacteria to the autoinducer inactivation protein. A blacterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This sequence encodes the autoinducer inactivation activity of which is studied in the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                   181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  298

```
polymucleotide is useful for increasing disease resistance in a plant or animal by introducing a polymucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human, and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polymucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B21 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This sequence encodes the autoinducer inactivation protein AiG, the autoinducer inactivation activity of which is studied in the invention. (Updated on 29-AUG-2003 to standardise OS field)
inactivation protein.
   (N-acyl-homoserine lactone)
      autoinducer

controlled to secrible an isolated polymeroculus endolling and autochindred (N-acyl-homoserine lattone) inactivation protein. The polymucleotide is useful for increasing disease resistance in a plant or animal by introducing a polymucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably but in a manner that allows the cell to express the gene. The protein is useful for reducing the formation of bacterial bidfilms, by exposing bidfilm-forming bacteriat to the autoinducer inactivation protein. A bacterial cell transformed with the polymucleotide, especially a plant or animal bacterium preferably Bacillus thuringiennis which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by utoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This sequence encodes the autoinducer inactivation protein AifF, the autoinducer inactivation activity of which is studied in the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATGACAGTAAAGAAGCTTTATTTCGTCCCAGCAGGTCGTTGTATGTTGGATCATTCGTCT 108

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for inoreasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably

human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polymucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carotovora. This sequence encodes the autoinducer inactivation protein AiiD, the autoinducer inactivation activity of which is studied in the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                          0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The particleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal by introducing a polynucleotide into a cell of such a plant or animal by introducing pacterial damage to a plant or animal preferably human; and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A animal bacterium preferably acidle sepecially a plant or animal bacterium preferably bacilles the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from Bl. B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers encodes the autoinducer inactivation protein Ail, the autoinducer inactivation activity of which is studied in the invention.

                                                                                                                                                                    à
                                                                                                                                                                                                   autoinducer (N acyl-homoserine lattone) inactivation protein. The autoinducer (N acyl-homoserine lattone) inactivation protein. The polymucleotide is useful for increasing disease resistance in a plant or animal by introducing a polymucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably fuman, and for reducing the formation of bacterial biofilms, by exposing biofilm-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polymucleotide, especially a plant or animal bacterium preferably Bacillus thuringieniss which is from B1, B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a disease in a susceptible plant or animal, where virulence is regulated by autoinducers e.g. potato soft rot disease caused by Erwinia carctovora. This sequence encodes the autoinducer inactivation protein AiH, the autoinducer inactivation activity of which is studied in the invention. (Updated on 29-AUG-2003 to standardise OS field)

The invention describes an isolated polynuclectide encoding an autoinducer (Nacyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or animal by introducing a polynucleotide into a cell of such a plant or animal, in a manner that allows the cell to express the gene. The protein is useful for reducing bacterial damage to a plant or animal preferably human, and for reducing the formation of bacterial biofilums, by exposing biofilum-forming bacteria to the autoinducer inactivation protein. A bacterial cell transformed with the polynucleotide, especially a plant or animal bacterium preferably Bacillus thuringiensis which is from Bl. B2, B17, B18, B20, B21, B22 and B25, is useful for increasing resistance to a
                                                                                                                708
                                                                                                                                                                                                                                 768
                                                                                                                                                                                                                                                                               Polynucleotide encoding autoinducer inactivation protein, bacterium having polynucleotide, and protein useful for increasing resistance to a disease in sustainable plant or animal and for reducing bacterial damage.

```

Autoinducer inactivation; AiiK; N-acyl-homoserine lactone;

encoding autoinducer inactivation protein AiiK

disease resistance; bacterial damage reduction; biofilm; potato soft rot disease; Erwinia carotovora; gene; ds.

Location/Qualifiers

Bacillus thuringiensis;

.753

/note= "Autoinducer inactivation protein"

/product= "AiiK"

Polynucleotide encoding autoinducer inactivation protein, bacterium having polynucleotide, and protein useful for increasing resistance to a disease in sustainable plant or animal and for reducing bacterial damage.
                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated polynucleotide encoding an autoinducer (N-acyl-homoserine lactone) inactivation protein. The polynucleotide is useful for increasing disease resistance in a plant or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ACTGTGATGGTCAACTACCCATATGAAATATTTTTTATAAGTCCCATCCTCGAAAGTAAT 1015
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative
                                                                                                           The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCACATATCACAGTCTATTAAATCTGATCCTTCTTCATCTAATGTTAATTTTCCTTTTTT

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with consultation of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences (CC complementary to (Ss). The nucleic acid may be a peptide nucleic acid conjugement (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single conjugement (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for accertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the 533 genomic sequences confirmed from tumour suppressor genes and oncogenes. Sequences with even compared seq 1D numbers are the complementary sequence of the numbered seq 1D numbers are the complementary sequence of the numbered seq 1D numbers are the complementary sequence of the number of the sequences and oncogenes. Sequences with the number of the sequences of the complementary sequence of the number of the sequences of the complementary sequence of the number of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complementary sequence of the sequences of the complem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fragments of chemically modified genes associated with tumor suppressor genes and oncogenes, useful in designing primers and probes for analyzing diseases associated with cytosine methylation state e.g. cancer.
Human; tumour suppressor gene; oncogene; antitumour; cytostatic; cancer; tumour; CpG dinucleotide; single-nucleotide polymorphism; SNP; cytosine methylation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       corresponding odd numbered sequence (e.g. ID 2 and ID1, ID 536 and ID 535, except for those whose partner sequence is missing). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID NO 56; 27pp; English.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system discorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Alzheimer's disease, Alzheimer's disease, and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

 the methylation of cytosines. The sequences
genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

XY

Oligonucleotide for diagnosis and therapy of diseases associated with signal transduction e.g. cancer, comprises chemically modified genomic PT signal transduction e.g. cancer, comprises chemically modified genomic XX

Claim 1; SEQ ID NO 354; 24pp; English.

XX

Claim 1; SEQ ID NO 354; 24pp; English.

XX

Cramal transduction associated genes. The DNA sequences are chemically condition associated genes. The DNA sequences are chemically condition associated genes. The DNA sequences are chemically condition of bisulphite, hydrogen sulphite or disulphite.

Also disclosed are oligonucleotides and/or PNA oligoners for detecting the cytosine methylation state (CpG islands) of these genes, and a method contained from cells or callular components which contain DNA, e.g. cell contained from cells or callular components which contain DNA, e.g. cell innes, biopsies, blood, sputum, stool, urine, cerebral-spinal fluid, tissue embedded in paraffin such as tissue from embedded in paraffin such as tissue from embedded in paraffin such as tissue from embedded in paraffin such as tissue from exposite combinations. The sequences of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction e.g. solid tumours and cancer. ABK11158-ABK31545 represent chemically pretreated genomic DNA sequences of different genes associated with signal transduction, or their complementary sequences. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence 47108 BP; 15349 A; 429 C; 8736 G; 22594 T; 0 U; 0 Other:
